

VISA DOO AUDIT REPORT

Security, Quality, and Stability Pass

Project Name: Visa Doo
Audit Date: 28 August 2026
Final Audit Result: PASSED (Wizard and back-button issues resolved)

Executive Summary

A comprehensive, project-wide security, quality, stability, and performance pass was performed on the Visa Doo application code. The audit evaluated frontend forms (wizards), date validation rules, back-office helpers, PDF form generators, serverless functions, and API route consistency.

All confirmed bugs have been successfully resolved in the codebase during this pass, significantly improving the reliability of the application submit and wizard navigation flows. No critical or high-severity active bugs remain. Remaining features that rely on external APIs and environments are documented for verification upon live credentials deployment.

Severity Summary

Total Confirmed Bugs: 2 (0 Active, 2 Resolved)

CRITICAL: 0 Active (1 Resolved: Ireland Wizard Step Lockout)
HIGH: 0 Active
MEDIUM: 0 Active (1 Resolved: Date Validation Section Misalignment)
LOW: 0 Active

Confirmed Bugs (Resolved)

BUG ID: BUG-001

TITLE: Ireland Visa Wizard Step Lockout

SEVERITY: CRITICAL

AFFECTED FILE: application.js

PROBLEM:

The step validation and navigation functions were hardcoded to limit step counts to 5. Because Ireland has a 6-step form, the final declaration section was unreachable and never validated, causing browser validation on the hidden checkbox to silently block submit.

RESOLUTION:

Updated showDenmarkSection and validateAllDenmarkSections to dynamically count sections in the DOM using document.querySelectorAll('.denmark-sec').length, enabling full navigation.

BUG ID: BUG-002

TITLE: Date Validation Section Misalignment

SEVERITY: MEDIUM

AFFECTED FILE: application.js

PROBLEM:

Date checks for travel dates and passport validity were hardcoded to sections 3 and 2. For countries like Azerbaijan (where travel dates are in section 2), this caused validation errors to focus and scroll the user to the wrong, empty section.

RESOLUTION:

Updated validateDenmarkSection to query the date inputs' closest('.denmark-sec') container dynamically, ensuring validation feedback only triggers on the step where the field is visible.

Possible Issues / External Testing

ISSUE ID: ISSUE-001

TITLE: Brevo Email Notifications Delivery

DESCRIPTION / REQUIRED TESTING:

Verification of actual email delivery (sign-in magic links and status notifications) requires live Brevo API keys (stored in Supabase secrets) and a verified authenticated visadoo.com domain. Testing must be verified on the production database.

ISSUE ID: ISSUE-002

TITLE: WhatsApp OTP & Telinfy Integration

DESCRIPTION / REQUIRED TESTING:

WhatsApp OTP sending and verification is currently disabled in the configuration pending approval of the Meta message templates. Once templates are approved and live credentials are input, the otp flow needs verification.

ISSUE ID: ISSUE-003

TITLE: Gemini & OpenAI Chat Integrations

DESCRIPTION / REQUIRED TESTING:

The AI chat helpers fallback to static responses if the Gemini or OpenAI API keys are missing or invalid in the process environment. Live API response quality must be audited once keys are populated.
